     The compn. comprises cement 25.6-32.8, fly ash
     from thermoelec. plant 32.7-41, sodium sulfate 0.51-0.66, foaming agent
      (e.g., aluminum powder) 0.1-0.26, and tempering water in the
     balance. Sodium sulfate is used as alkali additive and hardening agent.
     The manuf. comprises (a) prepg. a viscous raw mix of components, (b) pre-activating fly ash, (c) swelling raw mix, (d) hardening during evapn. or under normal conditions, and (e) activating
     fly ash by combined grinding of all dry mix components
     for 20-40 min. Prior to grinding, dry superplasticizer S-3 in amt. of
     0.7-1% of cement wt. is added into the mix, and sulfanol
     surfactant is added into tempering water in amt. of 0.2-0.5% of
     water. The method improves properties of the compn.
